## Abstract

This data set analyzes how mature Canadians feel about their life, provided certain factors in life. The original Canadian General Social Survey on family was conducted in 2017. Survey data includes a target population of individuals who are 15 years of age or older in the 10 provinces of Canada. The survey's primary objectives are to gather data on social trends to monitor changes in the living conditions of Canadians throughout life, and to provide information on specific social policy issues of current interest. 20602 respondents had responded to the survey and is the sample size. The sampling frame is Statistics Canada's common telephone frame, which combines landline and cellular telephone numbers that are from the Address Register. Survey data were collected through self-completed online questionnaires and telephone interviews. A linear regression model was applied in order to observe if a linear relationship exists between the study variable and the auxiliary variables.

## Introduction

Here is where you should give insight into the setting and introduce the goal of the analysis. Here you can introduce ideas and basic concepts regarding the study setting and the potential model. Again, this is the introduction, so you should be explaining the importance of the work that is ahead and hopefully build some suspense for the reader. You can also highlight what will be included in the subsequent sections.

The goal of this analysis is to discover a linear relationship between the outcome variable and the auxiliary variables by utilizing a general approach of linear regression model. In this analysis, the study variable is feelings about life, and five auxiliary variables were selected to test if they indeed have a linear relationship with the outcome variable. The significance of the work is that through this model, an analysis can be built about how adult individuals in Canada feel about their life, considering the input variables. In the subsequent sections, results and discussion are covered to discuss weaknesses and next steps.

## Data

Introduce the data, explain why it was selected. Make sure to comment on important features and highlight any potential drawbacks to the data.

The selected output variable is feelings about life, and the auxiliary variables are age of the respondent, age at first birth, place of birth (whether it was in Canada or not), income of the respondent, and intention of having future children. We chose this study variable in the intent to scrutinize the life satisfaction rating of Canadians, whether this is dependent on certain factors in life. Also, we decided on the specific input variables because intuitively, they are the most suitable data for our hypothesis and to prove that indeed, there is a linear relationship between the y and x variables. A drawback to the data is that because of the numerous 'NA' responses, our population data size greatly decreased from the original sampled population number. Another drawback to the data is that there are numerous vague responses such as "Don't know" or "Unsure", which are difficult to place in order.

## Model

Introduce the selected model here. It is expected that you will use some mathematical notation here. If you do please ensure that all notation is explained. You may also want to discuss any special (hypothetical) cases of your model here, as well as any caveats.

We are interested in how some variables affect one's feelings towards life (**feelings\_life**). To analyze this, we fit a linear regression model with some independent/predictor variables.

The categorical variables are:

- **income\_respondent**, a discrete variable contains the income range of the respondent; the possible values are:

Income of Respondent
Less than \$25,000
\$25,000 to \$49,999
\$50,000 to \$74,999
\$75,000 to \$99,999
\$100,000 to \$ 124,999
\$125,000 and more

- **future\_children\_intention**: a discrete variable that records the respondent's attitude towards having children in the future; the possible values are:

Future Children Intention
Don't know
No, definitely not
Probably not
Unsure
Probably yes
Definitely yes

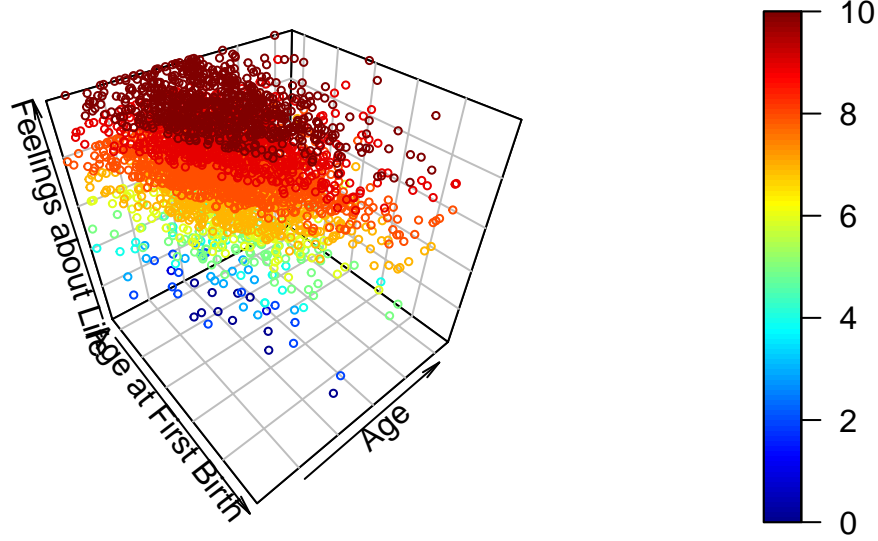

- **place\_birth\_canada**: a discrete variable that records whether the respondent was born in Canada; the possible values are:

Born in Canada?
Don't know
Born outside Canada
Born in Canada

For all of these categorical variables, we use dummy variable coding with the variable at the top representing the baseline, in order to be able to assess what effect, if any, moving to a category would have compared to the baseline.

The other predictor variables are:

- **age\_at\_first\_birth**: a continuous variable which describes the subject's age when they had their first child
- **age**: a continuous variable describing the subject's age

Using the GSS data, we replicated the approach used in the original survey. A single-stage stratified sampling approach by applying finite population correction to the sample was employed, adjusting each observation by the corresponding provincial population to reduce the variation. Then, we fitted a generalized linear model to the survey design, yielding the following model:

$$\begin{aligned}
 y = & \beta_0 + \beta_1 x_1 + \beta_2 x_2 \\
 & + \underbrace{\beta_{3a} x_{3a} + \beta_{3b} x_{3b} + \beta_{3c} x_{3c} + \beta_{3d} x_{3d} + \beta_{3e} x_{3e}}_{\text{dummy coding for income}} \\
 & + \underbrace{\beta_{4a} x_{4a} + \beta_{4b} x_{4b}}_{\text{dummy coding for place birth Canada}} \\
 & + \underbrace{\beta_{5a} x_{5a} + \beta_{5b} x_{5b} + \beta_{5c} x_{5c} + \beta_{5d} x_{5d} + \beta_{5e} x_{5e}}_{\text{dummy coding for future children intention}}
 \end{aligned}$$

	Variable	Beta (SE)	95% CI	P
	$\beta_0$ Intercept	9.88 (0.86)	(8.19, 11.56)	<0.001
	$\beta_1$ age_at_first_birth	0.00 (0.01)	(-0.01, 0.01)	0.99
	$\beta_2$ age	-0.01 (0.00)	(-0.01, 0.00)	0.25
income cat. var	as.factor(income_respondent)			
income baseline	Less than \$25,000 (ref)	-	-	-
	$\beta_{3a}$ \$25,000 to \$49,999	0.14 (0.09)	(-0.05, 0.32)	0.14
	$\beta_{3b}$ \$50,000 to \$74,999	0.26 (0.09)	(0.07, 0.44)	0.006
	$\beta_{3c}$ \$75,000 to \$99,999	0.36 (0.10)	(0.16, 0.55)	<0.001
	$\beta_{3d}$ \$100,000 to \$ 124,999	0.35 (0.12)	(0.11, 0.60)	0.004
	$\beta_{3e}$ \$125,000 and more	0.48 (0.12)	(0.23, 0.72)	<0.001
birthplace cat. var	as.factor(place_birth_canada)			
birthplace baseline	Don't know (ref)	-	-	-
	$\beta_{4a}$ Born outside Canada	-1.23 (0.33)	(-1.88, -0.58)	<0.001
	$\beta_{4b}$ Born in Canada	-1.29 (0.33)	(-1.93, -0.65)	<0.001
future children int. cat. var	as.factor(future_children_intention)			
future children int. baseline	Don't know (ref)	-	-	-
	$\beta_{5a}$ No, definitely not	-0.45 (0.76)	(-1.94, 1.05)	0.56
	$\beta_{5b}$ Probably not	-0.58 (0.77)	(-2.09, 0.92)	0.45
	$\beta_{5c}$ Unsure	-0.55 (0.77)	(-2.06, 0.97)	0.48
	$\beta_{5d}$ Probably yes	-0.56 (0.79)	(-2.10, 0.98)	0.48
	$\beta_{5e}$ Definitely yes	-0.52 (0.81)	(-2.10, 1.06)	0.52

## Results

Here you will include all results. This includes descriptive statistics, graphs, figures, tables, and model results. Please ensure that everything is well formatted and in a report style. You must also provide an explanation of the results in this section. You can overflow to an Appendix if needed.

Please ensure that everything is well labelled. So if you have multiple histograms and plots, calling them Figure 1, 2, 3, etc. and referencing them as Figure 1, Figure 2, etc. in your report will be expected. The reader should not get lost in a sea of information. Make sure to have the results be clean, well formatted and digestible.

## Discussion

Here you will discuss conclusions drawn from the results and comment on how it relates to the original goal of the study (which was specified in the Introduction).

## Weaknesses

Here we discuss weaknesses of the study, data, analysis, etc. You can also discuss areas for improvement.

## Next Steps

Here you discuss subsequent work to be done after this report. This can include next steps in terms of statistical analysis (perhaps there is a more efficient algorithm available, or perhaps there is a caveat in the data that would allow for some new technique). Future steps should also be specified in terms of the study setting (eg. including a follow-up survey on something, or a subsequent study that would complement the conclusions of your report).
